

DAY 2 PROMPT (Line, Rectangle, Triangle Drawing)

Extend the previously created 2D Graphics Editor in C by adding **basic shape drawing functions**.

Implement functions to draw:

- A **line** using two coordinate points
- A **rectangle** using starting position, height, and width
- A **triangle** using simple geometric line connections

All shapes must be drawn on the **2D character array canvas** using the character * (asterisk). The canvas should update and reflect changes after each drawing operation.

Integrate these functions into a **menu-driven system**, allowing the user to select and draw different shapes interactively.
